

Surviving market turbulence: fasten your seatbelt

Recognizing market downturns as a normal part of the economic cycle is the first step to surviving market turbulence.

The current economic downturn and the turbulent investment markets can make people nervous. That's understandable. But recognize these events as a normal, although undesirable, part of the economic and investment cycles.

With that in mind, here are some tips for the typical investor in a turbulent time.

Don't panic.

First, the worst thing to do is to over-react to anything occurring in the investment world. Some people may be tempted to bail out of their stock investments if markets are having a particularly rough ride. But that's EXACTLY what you should NOT be doing. Selling solely because the stock market tumbles may be the worst thing to do.

Stay invested.

If you're investing for a long-term goal—such as a retirement that begins in another decade or more and could last two or three decades—you'll have plenty of time to ride out the market cycles. Understand that a hypothetical projection of a steady 8 percent annual return, for example, doesn't really reflect the typical stock and bond market ups and downs. But you may average 8 percent a year in earnings as stock performance rises above and falls below that mark in any particular year.

If the stock market posted gains and losses in every other year, imagine what you'd lose out on by selling after a dip.

Two 8 Percent Solutions

An initial investment of \$10,000 compounding at a steady 8% a year would equal \$14,693 after five years. In the second scenario, showing more typical ups and downs in the market, the total after five years would be \$14,509.

This chart is hypothetical and for illustrative purposes only. It is not indicative of the performance of any specific investment. Investment return and principal values will fluctuate so your investment, when redeemed, may be worth more or less than its original cost. Past performance is no guarantee of future results. If the periods of positive return in the typical ups and downs comparison were years of actual losses an average of 8% return would not have been achieved.

And where would you put your money?

In a money market account, it might earn a steady 3 percent; however, that won't even keep up with the average long-term inflation rate of 3.1 percent. The easiest, safest and wisest thing for most long-term investors is simply to stay invested.

Stay focused on your long-term investing goals and don't react to short-term changes in the market.

Keep a long-term perspective.

It's easiest to stay the course if you really do focus on your major life goals and not on the market's day-to-day or month-to-month movements. It's good to check on what is happening in the markets and to understand why certain things are occurring, but don't review your investment portfolio too often. Look at your quarterly account statements, stay on top of the major current events in the financial and business worlds, and plan to do a thorough review of your investments—asset allocation, investment performance and progress towards your goals—once a year.

Dollar cost average.

One of the simplest and most effective approaches to investing is dollar cost averaging. You simply commit to investing the same dollar amount on a regular basis. When the price of shares in a stock or mutual fund rises, you'll buy fewer shares, and when the price dips, you'll buy more. This maintains your discipline as an investor and provides an opportunity to lower your average cost per share.

Maintain a diversified portfolio.

Diversification lowers your risk because not all parts of the market move in the same direction at the same time. Losses in one area are sometimes balanced out by gains elsewhere.

Know your risk tolerance.

Ultimately, you need to do what is right for you. If you find stock investments to be too risky for your taste—for example, if you can't sleep at night because you're worrying about your stocks—then, maybe you should consider a safer, steadier ride.

Make thoughtful moves.

If you make changes to your investments, do so in a thoughtful way, and after careful consideration. Talking with a financial advisor could be a good first move.

An investment in money market funds is neither insured nor guaranteed by the Federal Deposit Insurance Corporation or any other government agency. Although money market funds seek to preserve the value of your investment at \$1 per share, it is possible to lose money by investing in these funds.

Neither dollar-cost averaging nor diversification ensure a profit or protect against a loss in a declining market. Plan sponsors and participants should carefully consider the investment objectives, risks, charges and expenses of the investment options offered under the retirement plan before investing. The prospectuses for the individual mutual funds and The Standard's Group Variable Annuity Contract and each underlying investment option in both the group variable annuity and group annuity contain this and other important information. Prospectuses may be obtained by calling 877.805.1127. Please read the prospectus carefully before investing.
